Santiago Leiva | Official Artist Platform 🎵

A cinematic, high-performance web portfolio for electronic music artist **Santiago Leiva**. Combining the bold, industrial aesthetic of top-tier techno visual identities with a highly interactive, taxonomic layout for music releases and tour dates.

NEXT.JS 14+ | TYPESCRIPT | TAILWIND CSS | FRAMER MOTION | DEPLOYMENT GITHUB PAGES

✨ Key Features

- **Cinematic Dark Mode**: A custom `zinc-950` design system that provides a premium, immersive user experience.
- **Live Spotify Integration**: Taxonomic music grid that dynamically renders real playable Spotify iframes to showcase releases and playlists directly in the UI.
- **Fluid Interactions**: App-wide animations, layout crossfades, and interactive overlay menus orchestrated by Framer Motion.
- **Tour Engine**: Structured and responsive gig-listing with dynamic states (e.g., Sold Out notifications) and ticket hooks.
- **Static & Fast**: Architected for static export (`output: 'export'`), enabling global CDN distribution and robust hosting via GitHub Pages.

🛠️ Tech Stack

- **Framework:** Next.js (App Router) / React
- **Language:** TypeScript
- **Styling:** Tailwind CSS v4
- **Animation:** Framer Motion
- **Icons:** Lucide React
- **DevOps:** Automations via GitHub Actions & custom Python scripts

🚀 Getting Started (Local Development)

You can easily run this project locally using the custom Python orchestrator, which automatically manages environment paths and boots the Node server.

Prerequisites

- Node.js (v18 or higher recommended)
- Python 3.x

Run Local Environment

1. Clone the repository to your machine.
2. Ensure you are in the root directory.
3. Run the custom orchestrator script:

```
python run_dev.py
```

Alternatively, if you prefer the standard Node.js workflow:

```
cd frontend
npm install   # Installs all required dependencies
npm run dev   # Starts the development server at localhost:3000
```

📦 Deployment (Production)

This application has a fully automated CI/CD pipeline integrated with **GitHub Pages**.

- Pushing code to the `main` or `master` branch triggers the GitHub Action (`.github/workflows/deploy.yml`).
- The pipeline securely installs dependencies, builds the Next.js static output, and deploys it live.

> **Note:** If you plan to switch to a Server-Side Rendered (SSR) environment like Vercel or a Node VPS in the future, please consult the `frontend/DEPLOYMENT.md` documentation for migration steps.

Designed & Engineered meticulously for the global stage.
